Development of test scripts

About STET

STET provides payment processing services across the SEPA and domestic instruments including direct debits, credit transfers, card and ATM transactions and more.

The challenge

As a truly unique project, a number of challenges needed to be overcome:

- Understanding and developing a solution that accommodates all new technologies, players and regulatory requirements.
- Fime needed to combine and apply existing knowledge to define how best to test against the new specification's requirements.
- With a 2019 deadline, the pressure was on for Fime to work quickly, efficiently and effectively with a number of stakeholders.

“

Our mission to offer a standard open banking API and test platform was exciting but daunting, and Fime's support has been central to making it happen.

Nathalie Caye

Card Business Manager
Marketing & Development Department at STET

Why Fime?

Fime has a long history in ensuring banks' compliance with evolving security, quality and regulatory standards.

Fime had already scrutinized and developed a number of new open banking solutions.

Fime could drive this project to completion, with the resources and flexibility to respond to the challenges.

Customer requirements

As part of PSD2, the European Banking Authority's (EBA) Regulatory Technical Standards (RTS) requires banks offer a testing platform to financial application developers by March 2019.

STET decided to develop a standardized open-access API and companion testing platform to enable banks and fintechs to meet regulatory and legal requirements, ensure smooth integration between apps and bank infrastructure and expedite time to market for new services.

Fime's solution

Utilizing its expertise in the payments ecosystem, and over twenty years' experience in financial services, Fime provided consultancy to help STET map the project requirements and highlight complexities and challenges. It provided a thorough end-to-end review of STET's specification and offered recommendations for development of the testing platform.

Fime developed the test scripts in line with the specifications and compiled the application test plan. Working in collaboration with the sandbox supplier, these test scripts were then crafted into a software package and provided to participating banks and app developers.

The specifications and test platform have already been adopted by a number of banks in France and Fime continues to support the implementation of the open banking APIs.

Working with Fime

Throughout the project, Fime:

- Provided invaluable industry insight to support API test tool providers in designing best-in-class testing services to achieve PSD2 compliance.
- Utilized its experience in testing and working in cloud-based environments to deliver a comprehensive, quality test plan.
- Worked flexibly in collaboration with any sandbox provider.
- Delivered the solution within a tight timeframe, ensuring a speedy time to market at a competitive cost.

Making innovation possible.

With our global perspective, we combine our consulting and disruptive testing expertise to enable our clients to develop build and launch trusted digital payment experiences solutions across payments, banking and urban mobility.
